PUB NO. 31-16928

290D2158G005

Fault Code (Dec)	Name	Description	Repair Action
1	Lock Monitor	Lid lock didn't occur or lid lock signal not seen by control due to lack of connection.	<ul style="list-style-type: none"> • Check the resistance of the lid lock assembly. • Check the harness for open wires and/or connections. • If lock assembly and harness prove good at the control, replace lid lock.
2	Lid Monitor	Control did not get lid closed signal from switch while motor was moving. Could mean the switch didn't close or control didn't get the signal because of lack of connection.	<ul style="list-style-type: none"> • Replace lid lock if this happens frequently.
3	Locked Rotor Monitor	For 5 straight seconds control not seeing signal changes indicating the motor is turning while trying to spin. Could mean the motor isn't rotating or Control didn't get the signal because of lack of connection.	<ul style="list-style-type: none"> • Physically check the washer for anything preventing rotation. • Check harness and harness connectors from the motor to the control. • Verify hall sensor is connected to the main harness. Test. If hall sensor is bad or disconnected, the basket will stop after approximately 5 seconds. Ensure hall sensor is good. If basket spins for approximately 15 seconds, the TCO should reset in approximately 45 minutes. If nothing is jamming it. Replace motor if it does not spin.
4	Reset Monitor	Control is resetting the software by itself due to criteria it believes could resolve itself upon reset.	<ul style="list-style-type: none"> • Check for loose connections at the control. Reconnect if needed. • Check for recommended house line voltage to the control.
5	Mode Shifter	Control didn't see the transition from Agitate to Spin or vice-versa in the time required. Could mean the shift didn't occur or Control didn't get the signal because of lack of connection.	<ul style="list-style-type: none"> • Check mode shifter coupler for damage and the mode shifter motor. • Using an ohm meter, check to ensure mode shifter motor is connected to the control. • Check resistance of mode shifter motor (approximately 100 ohms). • Check for 120VAC to the mode shifter motor at the control. • If voltage is present, replace the mode shifter.
6	Critical Flood Level by Pressure. Pressure level exceeds 17.5" above pressure port.	Control received an extended period of pressure readings that is nearing over-flow levels. Pressure 17.5". Voltage Output must be present. Could mean water did get that high due to briefly stuck water valve. Voltage output of sensor too high for actual water level because of sensor or water in pressure tube increasing pressure.	<ul style="list-style-type: none"> • Check pressure tube for pinches where it goes through the inner wall. • Check pressure tube for trapped water. • Check water valve operation and for any leaking water. • Check the output voltage from the pressure sensor according to the pressure sensor chart. • Ensure pressure chamber port is free from obstruction through the inner wall.
7	Max Fill - Pressure. Pressure level exceeds 16.5" above pressure port.	Main micro received an extended period of pressure readings that is greater than maximum allowable fill volume. Pressure 16.5". Voltage output must be present. Could mean water did get that high due to briefly stuck water valve. Voltage output of Sensor too high for actual water level because of sensor or water in pressure tube increasing pressure. This could happen during normal operation.	<ul style="list-style-type: none"> • This can happen if a large wet load is placed in the basket. • Check pressure tube for pinches where it goes through the inner wall. • Check pressure tube for trapped water. • Check for any leaking water valves. • Check the output voltage from the pressure sensor according to the pressure sensor chart.
8	Pressure Sensor Loss	This determines if there has been a too great of a difference in the pressure sensor reading and the expected pressure sensor reading for the amount of water the control calculated it has put in. It assumes there is a pressure leak, a clog in the pressure hose/ system delaying the increase in pressure, or a significant amount water leaking out.	<ul style="list-style-type: none"> • Check to make sure house water supply valves are open. • Check water valve operation. • Check pressure tube for pinches where it goes through the inner wall. • Check the output voltage from the pressure sensor according to the pressure sensor chart. • Check pressure tube for trapped water. • Ensure pressure chamber port is free from obstruction through the inner wall.
9	Lid Switch Redundancy	Start attempted for a 4th cycle when the previous 3 cycles have completed with backup micro seeing lid open. Could mean the switches didn't occur or backup processor didn't get the signal because of lack of connection. See Fault #2 as well.	<ul style="list-style-type: none"> • Open and close the lid to clear the error. • Check harness and connectors that go to the lid switch. • If the error will not clear, replace the lid switch.
10	Mode Shift Feedback Monitor	Signal feedback state from the mode shifter (agitate or spin) and the state requested by the control are not the same and the basket or agitator is rotating faster than 3-4 RPM. Agitate mode feedback signal is no voltage.	<ul style="list-style-type: none"> • Check mode shifter coupler for damage and the mode shifter motor. • Use ohm meter to ensure harness shows continuity to the mode shifter motor. • Check resistance of mode shifter motor (approximately 100 ohms). • Check for 120VAC to the mode shifter motor at the control. • If voltage is present and no operation, replace the mode shifter.
11	Clock Monitor	1. AC power line frequency is not 60Hz. 2. Software failure.	<ol style="list-style-type: none"> 1. Check the frequency of the AC power outlet. If not 60Hz, contact utility. 2. If house frequency is good, update software.
12	Redundant Flood Condition	Backup processor received an extended period of pressure readings that is nearing over-flow levels. Pressure 18.0". Voltage output must be present. Could mean water did get that high due to briefly stuck water valve. Voltage output of sensor too high for actual water level because of sensor or water in pressure tube increasing pressure.	<ul style="list-style-type: none"> • Check pressure tube for trapped water. • Check each valves operation. (Replace water valve if needed.) • Check the output voltage from the pressure sensor according to the pressure sensor chart. • Check pressure tube for pinches where it goes through the inner wall. • Ensure pressure chamber port is free from obstruction through the inner wall.

⚠ WARNING  **Electrical Shock Hazard**

Death or serious injury can result from failure to follow these instructions.

- Service by a qualified service technician only.
- Disconnect power before servicing this product.
- Reconnect all grounding devices after service.
- Replace all parts and panels before operating.

⚠ ADVERTENCIA  **Riesgo de Descarga Eléctrica**

Usted puede morir o sufrir lesiones graves si no siguen estas instrucciones.

- El servicio técnico sólo debe ser realizado por un técnico calificado.
- Desconecte el suministro de corriente antes de realizar el servicio técnico.
- Luego del servicio técnico, vuelva a conectar todos los dispositivos de conexión a tierra.
- Reemplace todas las piezas y paneles antes de utilizar.

⚠ AVERTISSEMENT  **Risque de choc électrique**

Vous pouvez être tué ou gravement blessé si vous ne suivez pas ces instructions.

- Réparations seulement par un technicien qualifié.
- Débranchez l'alimentation électrique avant la réparation.
- Rebranchez tous les dispositifs de mise à la terre après la réparation.
- Remettez toutes les pièces et panneaux en place avant d'utiliser l'appareil.

WATER LEVEL SWITCH

BEFORE DISCONNECTING HOSE FROM WATER LEVEL SWITCH, BE SURE WATER LEVEL IN MACHINE IS BELOW BOTTOM OF WASH BASKET. AFTER RECONNECTING HOSE, PUT MACHINE IN SPIN FOR AT LEAST ONE MINUTE BEFORE CHECKING OPERATION OF SWITCH.

① To Remove Control Panel:

1. Remove the two hex head screws from the top rear corners of the control panel.

2. Grasp the control panel sides, push it back, and roll it toward the rear so the pressure sensor tube can be seen where it connects to the control board.

IMPORTANT:

② To Remove Lid:

- Remove the two 1/4" hex screws from the top cover and slide towards the front.
- Open the lid, remove the top cover, and slide it to remove.

③ To Remove Top Cover:

1. Complete previous steps.
2. Remove two 1/4" hex screws from the top cover.
3. Slide the harness grommet towards the front.
4. Disengage the power cord from the front part of the cord and disconnect the cord.
5. Raise the rear of the top cover and disengage the front clips.

Consumer Help Indicators

• Models with a display on the control panel

Your washer is equipped with Consumer Help Indicator (CHI). CHI is our way to communicate a simple remedy for some situations that you can perform without the need to call for service. The chart below describes the helpful messages you may notice scrolling on your display when you return to start another load. These messages will provide simple remedies you can quickly perform.

Spin light blinking	If an out-of-balance condition is detected by the washer, the Spin light will blink during the remaining portion of the cycle and will stay illuminated for a short time after cycle completion. When this occurs, the washer is taking actions to correct the out-of-balance condition and complete the cycle normally. In some cases, the washer may not be able to balance the load and spin up to full speed. If you notice the load is more wet than normal at the end of the cycle, redistribute the load evenly in the wash basket and run a Drain & Spin cycle.
"H2O SUPPLY" (Water not entering washer)	Check your house water supply. Did you forget to turn on one or both supply valves after installation or coming back from vacation? As soon as the message starts to scroll, the washer will initiate a 4 minute lock-out period. The washer controls won't respond/change during this time. After the 4 minutes, you can begin your cycle again. If you try to bypass the lock-out period by unplugging the washer, the 4 minute timer will start over again.
"CANCELEd"	"CANCELEd" may scroll on the display if the machine was paused for longer than 24 hours, water was left in the machine for 15 minutes with lid open or if the machine has stopped itself before the cycle completed due to certain errors. As soon as the message starts to scroll, the washer will initiate a 4 minute lock-out period. The washer controls won't respond/change during this time. After the 4 minute period, you can begin your cycle again. If you try to bypass the lock-out period by unplugging the washer, the 4 minute timer will start over again. If the problem persists, call GE Appliances at 800.GE.CARES (800.432.2737) for service.
"Lid"	"Lid" will be shown on display if 3 cycles have been started without opening the lid. The washer will not start another cycle until the lid is opened. Try opening, then closing the lid and starting a new cycle. If the problem persists, call GE Appliances at 800.GE.CARES (800.432.2737) for service.

• Models without a display on the control panel

Your washer is equipped with Consumer Help Indicator (CHI). CHI is our way to communicate a simple remedy for some situations that you can perform without the need to call for service. The chart below describes the helpful lights you may notice flashing on the display.

Spin light blinking	If an out-of-balance condition is detected by the washer, the Spin light will blink during the remaining portion of the cycle and will stay illuminated for a short time after cycle completion. When this occurs, the washer is taking actions to correct the out-of-balance condition and complete the cycle normally. In some cases, the washer may not be able to balance the load and spin up to full speed. If you notice the load is more wet than normal at the end of the cycle, redistribute the load evenly in the wash basket and run a Drain & Spin cycle.
Fill light (Water not entering washer)	Check your house water supply. Did you forget to turn on one or both supply valves after installation or coming back from vacation? As soon as the light starts to flash, the washer will initiate a 4 minute lock-out period. The washer controls won't respond/change during this time. After the 4 minutes, you can begin your cycle again. If you try to bypass the lock-out period by unplugging the washer, the 4 minute timer will start over again.
Lid Locked light	Lid Locked light will flash if 3 cycles have been started without opening the lid. The washer will not start another cycle until the lid is opened. Try opening, then closing the lid and starting a new cycle. If the problem persists, call GE Appliances at 800.GE.CARES (800.432.2737) for service.

Entry into Consumer Error Mode

- From an idle state only (all LEDs off), press and hold **Start** button for 10 seconds.
- After holding **Start** for 10 seconds, all LEDs will turn on, signifying the user may release the **Start** button.

Behaviors While In Consumer Error Mode

- The **Pause** and **Lid Locked** LEDs should be constantly blinking while in CEM.

Once the washer is in Service features are available via the

<p>7 </p>	<p>Cold Water Valve</p>	<p>Pressing Start will toggle the cold water valve on and off. Test will have a timeout for how long valve will be on (1 minute). The valve will turn off when the test is exited.</p>
<p>8 </p>	<p>Fabric Softener Dispenser</p>	<p>Pressing Start will toggle the fabric softener valve on and off. Test will have a timeout for how long valve will be on (1 minute). The valve will turn off when the test is exited.</p>
<p>9 </p>	<p>Spray Rinse Valve Check</p>	<p>Pressing Start will toggle the spray rinse valve on and off. Test will have a timeout for how long valve will be on (1 minute). The valve will turn off when the test is exited.</p>
<p>10 </p>	<p>Pressure Sensor</p>	<p>Pressing Start will start the test. Pressure sensor test will have a timeout. All valves will turn on. All LEDs will blink at start of test. Stop blinking LEDs as approximate water levels are crossed. The levels are: 2", 3", 4", 5", 6" and 7" Water valves shut off at this level. NOTE: 2" pressure level not supported on GTW750 model.</p>
<p>11 </p>	<p>Recirculate Pump</p>	<p>Pressing Start will toggle the recirculation pump on and off. Test will have a (1 minute) timeout for how long recirculation pump will be on. The recirculation pump will turn off when the test is exited.</p>
<p>12 </p>	<p>Drain Pump</p>	<p>Pressing Start will toggle the drain pump on and off. Test will have a (4 minute) timeout for how long drain pump will be on. The drain pump will turn off when the test is exited.</p>
<p>13 </p>	<p>Lid Switch</p>	<p>Pressing Start will start the test. When the lid is open, the Spin status LED will blink. When the lid is closed, the Rinse status LED will blink.</p>
<p>14 </p>	<p>Spin</p>	<p>Pressing Start will start the test. Spin test will perform child safety algorithm before it starts to spin. (Two (2) sprays of water before locking the lid.) The lid must be closed to start the test. If lid is open the Locked LED will blink. When started, the mode shift to spin will occur if required and the lid will be locked. When mode shift is complete, the washer will begin spinning to max spin speed for the model being tested. Spin test will have a (4 minute) timeout. Be sure to only run this test with an empty basket as there is no OOB detection during this test. The spin will stop when the test is exited.</p>

3. Disconnect the pressure sensor tube from the control board.
4. Roll the control panel toward the front and carefully lay it on its face on the top cover.
5. Remove four 1/4" hex head screws that mount the rear backslash panel to the control assembly.
6. Disconnect all harness connectors from the control board.

1. With a small screwdriver cap or cup from the agitator.
2. Remove the 7/16th hex bolt.
3. Pull the impeller/agitator.

- NOTE:** On two stage agitator systems, the agitator must be removed to access the 7/16th hex bolt. This is done by twisting the agitator base (clockwise) to unsnap it from the top cover. A Phillips screwdriver can be used to remove the agitator by doing the following:
- A. Insert the screwdriver into the center of the agitator.
 - B. Rotate the agitator until the screwdriver is seated into a recessed area of the agitator base.
 - C. Once the screwdriver is seated, push the screwdriver against the wall of the recessed area to assist with twisting the agitator base to access the 7/16th hex bolt.

Remove the cap off of the impeller or remove the

nut that secures the impeller/agitator to the shaft.
Remove the nut from the shaft.

Models with
a 1/2" shaft
needs to be
removed with
a 1/2" hex bolt. This
hex bolt is used
to secure the auger right
to the agitator base.
Remove the hex bolt
to remove the

nut from the existing hole in

the agitator. A
power driver seats
the nut into the
portion of the

agitator. Then, tap it through
the agitator. This
allows the
nut to be removed
from the auger off of
the hex bolt.

- Pressing **Start** will display the next fault code.
 - Models without 7-segment display: Fault code will blink in binary - the consumer will report which LEDs are blinking and which are not. See **Binary Display Fault Chart**.
 - Models with 7-segment display: Fault code will blink on the 7-segment display.
- At the end of the fault list or if no faults present:
 - Models without 7-segment display: All status LEDs will blink.
 - Models with 7-segment display: 7-segment display will blink “—”.

Exiting Consumer Error Mode

- Pressing any button (other than **Start**) or turning any knob will exit Consumer Error Mode.
- Consumer Error Mode will time out after 10 minutes

Field Service Mode Entry

From an idle state only (all LEDs off), press and hold **Start** button while rotating the cycle selection knob 180 degrees (7 clicks) and then release the **Start** button.

- Once service mode is entered all LEDs will be flashing.
 - On 7-segment display models: (0) will be displayed for Test (0).
 - On models without a 7-segment display: All of the status LEDs above the cycle knob will be lit.
- The cycle selection Knob is now used to control the test selection menu.
 - Rotating the knob clockwise will increment the test numbers in the display.
 - Rotating the knob counter clockwise will decrement the test number in the display.
 - **Models without 7-segment display: Will display tests using the status lights above the cycle knob in a binary format. (See Binary Chart)**
 - Turning the knob to go to a different test will terminate any current active state.
- Once test number is selected, pressing **Start** will begin the selected test.

Exit Field Service Mode

- Field service mode will time out after 30 minutes if there is no user activity.
- Models without 7-segment display: Press and hold the **Start** button for 3 seconds
- Models with a 7-segment display: Press **Power** button

② To Remove Lid:

- Remove the two 1/4" hex screws that secure the backsplash to the top cover and slide towards the rear of washer.
- Open the lid, remove the four screws (two each side) and lift the lid up to remove.

③ To Remove Top Cover:

1. Complete previous component removals ① and ②.
2. Remove two 1/4" hex head screws at the rear of the top cover.
3. Slide the harness grommet out toward the rear of the washer.
4. Disengage the power cord from the top cover by lifting up on the front part of the cord and then slide forward to remove.
5. Raise the rear of the top cover up and pull forward slightly to disengage the front clips.

3. Disconnect the pressure sensor tube from the control board.
4. Roll the control panel toward the front and carefully lay it on its face on the top cover.
5. Remove four 1/4" hex head screws that mount the rear backslash panel to the control assembly.
6. Disconnect all harness connectors from the control board.

1. With a small screwdriver, pry the cap off of the impeller or remove the cap or cup from the agitator.
2. Remove the 7/16th hex bolt that secures the impeller/agitator to the shaft.
3. Pull the impeller/agitator off the shaft.

NOTE: On two stage agitator models with an auger system, the auger first needs to be removed to access the 7/16th hex bolt. This is done by twisting the base of the auger right (clockwise) to unsnap it from the agitator base. A Phillips screwdriver can be used to remove the auger by doing the following:

- A. Insert the screwdriver into the existing hole in the auger.
- B. Rotate the auger until the screwdriver seats into a recessed area of the inner portion of the auger.
- C. Once the screwdriver is seated, tap it through the wall of the recessed area. This allows the screwdriver to assist with twisting the auger off of the agitator base to access the hex bolt.
